What concepts should I learn before Spring Boot according to the knowledge graph?

Great news — I found the learning path for **Spring Boot** in the knowledge graph! Here's what you should know:

📚 Prerequisites for Spring Boot

According to the **project-curated-learning-path**, you should learn the following concepts **before** diving into Spring Boot:

#	Concept	Why It Matters
1	**Java**	Spring Boot is a Java-based framework — you need solid Java fundamentals first
2	**Object-Oriented Programming (OOP)**	Spring Boot relies heavily on OOP principles like classes, inheritance, and interfaces
3	**REST API**	Spring Boot is widely used to build RESTful web services, so understanding REST concepts is essential

4	**JDBC**	Spring Boot often works with databases; JDBC is the foundational layer for Java database connectivity
5	**MVC Architecture**	Spring Boot follows the Model-View-Controller pattern — knowing MVC helps you understand how the framework is structured

---

🗺️ Recommended Learning Order

A logical progression would be:

```
Java → OOP → JDBC → REST API → MVC Architecture → Spring Boot
```

💡 Tips

- If you're new to Java, start with the **basics** (syntax, collections, exceptions) before moving to OOP concepts.
- **JDBC** will give you a taste of database interaction in Java, which Spring Boot's JPA/Hibernate abstractions build upon.
- Understanding **MVC** will make Spring Boot's `@Controller`, `@Service`, and `@Repository` layers much more intuitive.
